IISSUE SPECIFICITY: WIDELY EXPRESSED.

INSCELLANDEUS: THE BETA SUBUNIT SEEMS TO BE ENCODED BY A MULTIGENE PARILY: EACH DIFFERRY SUBUNIT MAY HAVE SPECIALIZED FUNCTIONS.

SIMILARITY: BELONGS TO THE NA+/K+ AND H+ ATPASES BETA CHAIN

```
The present sequence is the antigenic epitope P599, derived from merozoite surface protein-1 (MSP-1) of the asexual blood stage of plasmodium falciparum. It is used in the construction of recombinant protein Construction of recombinant protein comprises, melittin signal peptide, carcine. The recombinant protein comprises, melittin signal peptide, carcine. The recombinant protein comprises, melittin signal peptide, carcine protein protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (SSP-2), apical membrane antigen-1 (AAA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, PGZ7. These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/NIIMALVAC-1 vaccine has antipartal infections. Anti-CDC/NIIMALVAC-1 varcine has maintal infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Recombinant protein; CDC/NIIMALVAC-1; multivalent; malaria; vaccine; T-cell epitope; tetanus toxold; antigenic epitope; treatment; circumsporozoite protein; CSP; sporozoite surface protein-2; SSP-2; liver stage antigen-1; LSA-1; merozoite surface protein-1; MSP-2; apical membrane antigen-1; AAA-1; erythrocyte binding antigen-175; EBA-175; rhoptry associated protein-1; RAP-1; gamete specific antigen; pf927; antiparasitic; prevention; anti-CDC/NIIMALVAC-1 antibody;

The present sequence is that of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His)6 tag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical membrane antigen-1 (RAP-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of plasmodium falciparum. CDC/NIIMALVAC-1 waccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting P. falciparum in biological samples.

                                   Producing malaria vaccine, useful for treatment or prevention of all forms of malaria in humans, by expressing immunogenic merozoite protein fragment in a baculovirus system
                                                                                                              The present sequence represents a major merozoite surface protein-1 C-terminal fragment of 42kDa (MSP1-42). This fragment is linked to a melittin signal peptide, and then expressed in a in a silkworm/baculovirus system. The protein is used to prepare a malaria vaccine, which is used to treat or prevent malaria, caused by any of the four species of Plasmodium that infect humans.
                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           In the specification this sequence is given the SEQ ID NO. 26 and is encoded by the nucleotide sequence having SEQ ID NO.25. References to SEQ ID NO. 25 in the text give the clone as $46 which was selected by complementation in S.cerevisiae strain RS60.15B. The yeast strain carries a mutant RAS2 allele such that cells are unable to grow at 36 deg.C. There are two open reading frames and the two corresponding amino acid sequences are printed as SEQ ID NO. 3 & and 27, although only NO.26 is actually mentioned in the text. It is described as being homologous to the S6 protein kinase of Xenopus laevis. N.B. many of the references in the text of

complementation of two genetically altered S. cerevisiae and S. pombe strains. Clone 546 was selected by complementation in S. cerevisiae and S. pombe strains. Clone 546 was selected by complementation in S. cerevisiae at strain S. Clone 546 was selected by complementation in S. cerevisiae strain RSG0 15B. This strain contains a mutant allele of RAS2, RAS2(vall9ala15), which renders cells unable to grow at 36 deg. C, because such cells are defective in RAS function at elevated temperatures. Human cDNA's from a human glioblastoma cell library were selected that could complement this defect. The deduced sequence of 546 is homologous to a Xenopus laevis gene that encodes a known protein kinase, the 56 protein kinase. Plasmid pML5 was selected by complementation in S. cerevisiae strain SKN37 Tails strain contains a secciated protein of undetermined function. As a consequence of this gene disruption, SKN37 fails to grow in medium rich in amino acids. Human cDNA's were chosen which could complement this defect. Plasmids pATG16 and pATG29 were selected by complementation in the S. pombe cityloid strain SP565. This strain is homozygous for disruptions of ras1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequences given in AAW00087-89 and AAW00101 are encoded by plasmid fragments which contain human glioblastoma cell cDNA inserts which do

The present invention describes new isolated RAS-related polypeptides and mammalian cyclic nucleotide phosphodiesterases (PDES). RAS-related polypeptides are capable of complementing a defective RAS function in yeast. The products can be used for screening for agents which can modify, complement or suppress a genetic defect in a biochemical pathway which can proteins affecting cell growth and maintenance. Developing agents that will selectively act upon PDEs is directed toward reproducing the causing the undesirable effects of cyclic nucleotides, e.g. bronchodilation, increased myocardial contractility, anti-inflammation, yet without causing the undesirable effects, e.g. increased heart rate or enhanced lipolysis. The products can also be used for therapeutic, diagnostic and prognostic uses. AAZ32229 to AAZ32285, and AAY9803 to AAX49830, content of the present
                                                                                                                                             0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 nucleotide
(ras1::LEU2). As a result of this mutation, this strain fails to sporulate, and human cDNA's were selected which could complement this defect. These genes have unknown function.
                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated RAS-related polypeptides and mammalian cyclic nucleot. phosphodiesterases, used for screening for agents which can modify complement or suppress genetic defects

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              encodes a mammalian cyclic nucleotide phosphodiesterase and is an insert present in the plasmids pPDE46 (ATCC 69522), pPDE43 (ATCC 6951) or pPDE39 (ATCC 69551) or pPDE39 (ATCC 69551) or pPDE39 (ATCC 69551) or pPDE39 (ATCC 69551) or pppE39 (ATCC 69551) or pppE39 (ATCC 69551) or popentic defect in a biochemical pathway in which camplement participates and are also used as hybridisation probes. The present proteins which can function in microorganisms, particularly yeast, to modify, complement, or suppress a genetic defect associated with an indentification or characteristic in the microorganism. AAA88162 to AAA88218 and AAA82614 to AAB20640 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            pPDE339 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated DNA encoding a mammalian cyclic nucleotide phosphodiesterase is present in plasmids pPDE46, pPDE43 or pPDE339 an is used to modify a genetic defect in a biochemical pathway in which cAMP participates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The present sequence is a zif (zoocin A immunity factor) protein.

The DNA molecule or vector for expressing zif is used to protect organisms susceptible to the bacteriolytic activity of zoocin A.

Non-pathogenic organisms expressing zif can be genetically modified to express zoocin A activity without being at risk from the bacteriolytic activity of zoocin A. The organisms are therefore reasistant to zoocin A. The non-pathogenic organisms that are zoocin A resistant are especially food grade bacteria, such as Streptococcus gordoni. The transformed non-pathogenic organisms that are zoocin A resistant are especially food grade bacteria, such as Streptococcus gordoni. The transformed non-pathogenic organisms are useful as antibacterial compositions, suitable for human ingestion as part of a foodstuff, nutriceutical, a composition are useful for preventing or inhibiting the growth of undesirable organisms susceptible to zoocin A. Additionally the antibacterial composition can be used to treat or prevent Streptococcal sore throat or dental caries. The antibacterials can also be used to treat animals, particularly horses that are infected with group C streptococci. GRAS (generally recognized as safe) organisms transformed with the zif encoding polynucleotides produce zoocin A without organisms then have a wide range of applicability in antibacterials, particularly foodstuffs.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAY36754-Y37949 are encoded by open reading frames (ORPS) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vaccines against chlamydia trachomatis. Antisenses and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, and veneral lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                    paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis;
nongonococcal uretritis; epidymitis; cervicitis; salpingitis;
bartholinitis; pneumopathy; venereal lymphogranulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents glycosidase isolated from Thermococcus chitonophagus. The enzyme or its encoding nucleic acid sequence is used for generating glucose from soluble oligosaccharides. The enzyme can be used in the food processing, pharmaceutical, textile, detergent and baking industries. The enzyme is also used to treat lactose intolerance, as a diagnostic reporter molecule, in corn wet milling or in the fruit juice industry. The enzymes can be used to hydrolyse guar gum to remove non-reducing terminal mannose residues. The nucleic acids encoding the enzyme may be used to generate probes to identify similar sequences.
                                                                                                                                                                                                                                                                                                                                 New thermostable glycosidase(s) - from Thermococcus, Staphylothermus and Pyrococcus, used in the textile, food processing, pharmaceutical, detergent and baking industries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is the amino acid sequence of glycosidase GC74-22G deduced from a polynucleotide (see AAV36913) of Thermococcus chitonophagus GC74 clone (22G) that grows optimally at 85 degC. The sequence shows 46% amino acid identity to a beta-galactosidase of sulfolobus sulfataricus ATCC 49255/MT4. The invention provides 18 polynucleotides (see AAV36907-24) coding for thermostable glycosidases (see AAW49888-75) having glucosidase, alpha-galactosidase, beta-mannasidase, beta-mannase, endoglucanase or pullulanase activity. Vectors and host cells are also claimed. A method is provided for producing the enzymes by recombinant techniques. A claimed method for generating glucose from soluble
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cell oligosaccharides comprises contacting a sample (selected from dairy products, fruit juice, detergent, textile, quar quim, animal feed, plant blomass or waste product) containing oligosaccharides (selected from maltose, cellobiose, lactose, sucrose, raffinose,
                                                                                                                                                                                                                                                                                                                               Glycosidase enzymes from organisms of the genera Staphlothermus, Pyrococcus and Thermococcus - for deriving sugar from oligosaccharides, useful in the e.g. food processing, textile or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A new method for the isolation of peptide(s) - comprises fusing the peptide to a granule forming protein and cleaving the peptide from the resulting fusion protein using a protease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAR72812 is a gamma-IFN/glucagon/BNP fusion protein, it was used to demonstrate a new method for the isolation of peptides. The fusion protein is recombinantly produced in transformed E. coli, the glucagon/BNP is then cleaved from the granule forming protein gamma-IFN, using a protease. The glucagon can now be isolated from the cell culture.
peptide to a granule forming protein and cleaving the peptide from the resulting fusion protein using a protease
                                                                                                                                                                                                                                                                                                                                                                                                                                              Gamma-IFN/glucagon/BNP; fusion protein; peptide isolation method; granule forming protein; protease cleavage; E. coli; B-type natriuretic peptide; gamma-interferon; recombinant production.
                                                             AAR72811 is a gamma-IFN/glucagon fusion protein, it was used to demonstrate a new method for the isolation of peptides. The fusion protein is recombinantly produced in transformed E. coli, the glucagon is then cleaved from the granule forming protein gamma-IFN, using a protease. The glucagon can now be isolated from the cell culture.

Sequence 28, Application US/09146249A

Patent No. 60693-00

CENERAL INFORMATION:

APPLICANT: Colicelli, John J.

TITLE OF INVENTION: Cloning by Complementation and Related

TITLE OF INVENTION: Processes

NUMBER OF SEQUENCES: 85

CORRESPONDENCE ADDRESS:

ADDRESSE: Marshall, O'Toole, Gerstein, Murray & Borun

STREET: 6300 Sears Tower, 233 South Wacker Drive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 688;

-!- FUNCTION: CELL WALL FORMATION. CATALYZES THE ADDITION OF D-GLUTAMATE TO THE NUCLEOTIDE PRECURSOR UDP-N-ACETYLMURAMOYL-L-ALANINE (UMA) (BY SIMILARITY).

-!- CATALYTIC ACTIVITY: ATP + UDP-N-ACETYLMURAMOYL-L-ALANINE + D-GLUTAMATE = ADP + ORTHOPHOSPHATE + UDP-N-ACETYLMURAMOYL-
                            20-AUG-2001 (Rel. 40, Last annotation update)
